

The best way to optimize your team's petrophysical productivity

PowerLogSE

Market leading

Petcom's **PowerLog™** has been the market leading, Windows™-based, high performance analytical software for petrophysical interpretation since the early 90's. This powerful and user friendly application allows both geoscientists and petrophysicist to optimize well log interpretation workflows.

Committed to development and support

Since Fugro-Jason acquired Petcom last year, the two companies have been aggressively addressing both short- and long-term plans for PowerLog's future development and support.

Petcom's **PowerLogSE**, the "Second Edition" release of PowerLog, is a result of these efforts to develop this next generation of PowerLog. With PowerLogSE, Petcom has introduced an updated user interface and entirely new montage capability in PowerLogSE's built-in **Collage Tool**. So, in addition to PowerLog's well-known and widely-used interpretation capabilities, users can now include, and correlate, depth-registered graphical images such as scanned log plots and maps (rasters), and even log core images, along with their interpreted well log data.

In addition to an expanding functionality, users of PowerLogSE have access to a continuously growing technical support network of petrophysicists and rockphysics staff around the world.
